                                                                     The present invention relates to coding sequences of the murine 1F7 anti-idiotypic antibody complementarity-determining region (CDR) or framework-determining region (FR). The antibody binds to human or primat anti-human immunodeficiency virus (HIV) antibodies and can be used in the treatment of HIV infection. The present sequence is the 1F7 light chain

```

```
The present invention relates to coding sequences of the murine 1F7 anti-idiotypic antibody complementarity-determining region (CDR) or framework-determining region (FR). The antibody binds to human or primate anti-human immunodeficiency virus (HIV) antibodies and can be used in the treatment of HIV infection. The present sequence is the 1F7 light chain coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              241 Gridokadakadakadaracirantakarantakadararanarakadakaranacada 300
New polynucleotide encoding a complementarity- or framework-determining region of an anti-idiotypic antibody that binds to human or primate anti- human immunodeficiency virus (HIV) antibodies, for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ATCTCCTGCAAGGCCAGCCAAAGTGTTGATTATGATGGTGATAGTTATATGTGGTACCAA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes the light chain variable region of murine interleukin-4 (IL-4) antibody 3B9. The sequences are used in the production chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic dermathtis, atopic asthma, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by BLISA of circulating endogenous IL-4 levels in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              89.3%; Score 294.6; DB 20; Length 396; 94.9%; Pred. Th anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents the antibody 4H5 I chain fragment encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermaritis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD4 positive cells, which is useful for the collection of Mematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence encodes a murine derived protein fragment which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

murine anti-human Fas monoclonal antibody HFE7A. The CDNA was obtained from HFE7A-secreting hybridoma cells (FERM BP-5828) by RT-PCR (see AAV03031-37) which, like HFE7A, are capable of inducing of HFE7A (see AAV03031-37) which, like HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting as read to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, hashimoto's disease, graft versus host disease, solventare, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myssthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, mycarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, Audomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, Audomyopathy, glomerular nephritis, hypoplastic (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the mutine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, arcopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulomephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. The present sequence represents CDNA encoding the light chain of the mutine anti-human Fas monochonal antibody HFETA, which is produced by hybridoma HFETA (FERM-BP-5828).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 dacarrerecteacceaarcrecaecricirrescrererereraradecaeaeaeeeee 120

This invention describes a novel humanized anti-Fas antibody-like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by inding to Fas on the cells surface, and prevents of sopoptosis in cells with a normal system, by inhibiting binding between anti-aremic, antidiabetic, anti-allergic, anti-arrhitic, antidiamatory, antidiabetic, anti-inflammatory, inmunoamodulatory, dermachological, immunoamosesive, thyromimetic, antistancerological, immunoamosesive, thyromimetic, antistareriosclerotic, cardiant and hepatropic activity. (1) induce antistreriosclerotic, cardiant and hepatropic activity. (1) induce inhibition of ligand binding (1) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic upus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Slorgen's syndrome, permicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Consense, autoimmune hemolytic anemia, sterility, mysathenia gravis, multiple solerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, mycarditis, cardiomyopathy, glomenulomephritis, hepatists (fulminatt, chronic, viral (1) C or D) or alcoholic), and transplant rejection. (1) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells murine disease models. (1) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. inducing a human anti-murine antibody response. This sequence encodes a murine anti-Fas monoclonal antibody HFE7A light chain described in the method of the invention.

180 300 CCTGTGGAGGAGGATGCTGCAACCTATTACTGTCAGCAAAGTAATGAGGATCCTCGG 360 The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. 121 ATCTCCTGCAAGGCCAGCCAAAGTGTTGATTATGATGGTGATAGTTATATGAACTGGTAC CAACAGAAACCAGGACAGCCACCCAAACTCCTCACCTATGCTGCATCCAATCTAGAATCT GGGATCCCAGCCAGGTTTAGTGGCAGTGGGGTCTGGGGACAGACTTCACCCTCAACATCCAT GGGATCCCAGCCAGCTTTAGTGGCAGTGGGTCTGGGACAGACTTCACCCTCAACATCCAT CCTGTGGAGGAGGAGGATGCTGCAACCTATTACTGTCAGCTTTGTAATGAGGATCCTCCC Drug containing humanised anti-Fas antibody, used for preventing and treating autoimmune diseases, allergy, and atopy -Human; mouse; humanised anti-Fas antibody; Fas/Fas ligand; light chain subunit; apoptosis; immunosuppressive; antiallergic; autoimmune disease; allergy; atopic; ss. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents the antibody 4H5 H chain encoding nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 925;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, which is useful for lymphocytes from cells to be used in bone marrow transplantation of detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence encodes a murine derived protein fragment which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CD4 or CD34 and their use for ls -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents the antibody 4H5 L chain encoding nucleotide

/ Lone lib="Textor: pT730-pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from mammary gland tissue from a lactating female, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT73 vector. Library is normalized. Library was constructed by Bento Soares and M. Patima Bonaldo. "

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Spleen cells from mice immunized with human IL-4 were used to prepare hybridomas, which were screened for anti-IL-4 MAb secretion. Only clone 359 was positive. CDNA clones of the 359 light and heavy chains were cloned into pGENTf+ and transformed into B. coll DH5-alpha. The clones were sequenced (AAQ83490-91), and used for
            from high affinity mAbs - useful in treatment of IL-4-mediated and IgE-mediated allergic conditions
 Chimeric and humanised IL-4 monoclonal

   The present invention relates to coding sequences of the murine 1F7 anti-idiotypic antibody complementarity-determining region (CDR) or framework-determining region (FR). The antibody binds to human or primate anti-human immunodeficiency virus (HIV) antibodies and can be used in the treatment of HIV infection. The present sequence is the 1F7 light chain.

   This sequence represents the light chain of the murine 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation

murine interleukin-4 (IL-4) antibody 3B9. The sequences are used in the production chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in the rapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, reuningolobulin E-mediated allergic reactions e.g. allergic rhinitis, reunintotivitis, atopic asthms, atopic asthms, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the disgnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. b) BLISA of circulating endogenous IL-4 levels in humans.

   The invention provides an antibody having affinity to CD4 antigen. Th anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents a L chain fragment of the antibody 4H5.

Cluster differentiation; cell separation; antibody; CD4; CD34; leukemia; hematopoietic; undifferentiated; lymphocyte; bone marrow transplantation; HIV infection; autoimmune disease; murine.
  This invention describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived protein fragment which is used to illustrate the method of the invention.

New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS WPI; 1998-543440/01. N-PSDB; AAV70130.

Reference Example 4; Page 189-190; 292pp; English.

This is the amino acid of the light chain of murine anti-human Fas monoclonal antibody HFE7A. CDNA (see AAV70130) encoding the light chain was obtained from HFE7A-secreting hybridoam (FERB BP-5828)

RNA by RT-PCR (see AAW81021-37) produced by CDR grafting. These artibodies are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting as induced apoptosis in normal calls. They are used to evaluate, in animal models, treatments of clieases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune diseases (e.g. systemic lupus errythematosus, Hashimoto's disease, earth versus host disease, Sjogren syndrome, pernicious anaemia, Addison's disease, colerodaema, Goodpasture syndrome, Crohn's disease, autoimmune haemolytic anaemia, sterility, myasthenia purpura gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura

The invention relates to compositions for the prevention or treatment or desaess caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humaniead version of HEETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, colomorphy atopy, arteriosclerosis, myocarditis, cardiomyopathy, and organ graft rejection. The present sequence represents the light chain of the murine anti-human Fas monoclonal antibody HFETA, which is produced by hybridoma HFETA (FERM-EP-5828).

   This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas lagand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anticipated, anti-arthitic, antiviral, immunomodulatory, dermatological, immunosupressive, thyromimetic, antirheumatic, nephrotropic, anti-infertility, neuroprotective, antiarticoclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic

Drug containing humanised anti-Fas antibody, used for preventing and treating autoimmune diseases, allergy, and atopy -

Example 6 (Preparatory); Page 26; 194pp; Japanese.

The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                            582

Sequence 4, Application US/09903327A
Patent No. US20020164333A1
GENERAL INFORMATION:
APPLICANT: Li, Ergansang
TITLE OF INVENTION: BIFUNCTIONAL MOLECULES AND VECTORS COMPLEXED THEREWITH FOR TARGE.
TITLE OF INVENTION: DELIVERY
FILE REFERENCE: 22908-1228
CURRENT APPLICATION NUMBER: US/09/903,327A
